- **Core Features**: These are the basic state that the DRL sees, regardless of the network type.
- **Context Features**: (Area and Available Networks) define the current environment and the networks that can be chosen, thus influencing the decision.
- **Network Type**: This is not a predictive feature, but rather the identity of the current network, used for organizing data or defining actions.
- **NTN Features**: Rain and Rain Fade directly affect SAT(LEO) and HAPS links and can be considered unused for other networks.
- **UAV Features**: Altitude and Speed reflect the state of the UAV platform itself and do not apply to 5G, WiFi6, SAT, or HAPS.
